

2 LOCAL REFINERIES PUT YOU AND YOUR FAMILY AT RISK

Wilmington & Torrance refineries are the only refineries in California that use massive amounts of deadly Hydrogen Fluoride acid (HF/MHF). Other refineries in California use proven, safer alternatives.

Why won't these 2 switch?

HF is an enormous environmental burden to communities of color that surround the refineries. With a large release, HF spreads like a vapor cloud through the community, burning skin and lungs, and causing serious injury and even death.

Accidents, earthquakes, or intentional acts could cause a large release at any time.

This is a preventable risk to more than 800,000 people!

If you live, work or go to school in the impact zone, it's time to act.

Speak out by attending the event!
